Digital services. Connected operations.

Custom software, AI implementation and web design for businesses, public agencies and institutions.

What we build

Custom applications, customer and staff portals, dashboards and integrations. Websites and digital services with clear content, usable forms and accessible navigation. AI workflows for intake, document processing, summaries and approved responses.

Migration, accessibility and delivery

Content and system migration planning, data mapping and launch coordination. Accessibility audits and remediation against an agreed scope. Documented acceptance criteria, testing, training and handover. Maintenance and support are defined in the proposal.

How an engagement starts

Share the problem, users, existing tools and timing. We review the scope and dependencies with your team, agree the deliverables and responsibilities, then build and demonstrate the work. Code and data ownership, access, recurring costs and support are addressed in writing.

Work you can inspect

Marquee Recon is our working research application, connecting a customer brief, private accounts, saved evidence and report delivery. Our website portfolio includes live designs and project notes. These are product and design examples, not public-sector past-performance references.
